

Assessment of Needed Telecommunications Services, Hardware, Software and Related Services

Every computer in Plano ISD is connected to an internal campus network and every classroom has multiple connection outlets or wireless solutions for Internet access, application launching, file sharing and network printing. Every campus in Plano ISD has file servers. Access to the Internet is controlled via the file server at the campus level before the request travels to our district proxy server and router, which contain the district's filtering software. All campus LAN ethernet backbones are gigabyte capacity and provide switched 10/100 MB ethernet bandwidth to network computers and/or classroom 10/100 MB switches.

In previous technology plans, a primary concern for the district was to identify methods that would increase the amount of bandwidth available over our WAN infrastructure or to look at a new infrastructure that more appropriately supports our future needs. In addition, the district wanted to continue to improve and enhance the voice and video networks. The district addressed these concerns by awarding a contract to Southwestern Bell Communications to construct an ATM based private fiber optic wide area network, which became operational for the opening of school in fall of 2001. The network consists of a redundant OC-48 ring at four core sites, and each of the core sites connects to approximately one-fourth of the campuses. Eleven of the district campus sites connect to the core at OC-12 capacity, and the remainder at OC-3. The implementation of gigabyte ethernet campus backbones and the fiber optic wide area network provides the required bandwidth for voice, data and video telecommunications for the foreseeable future.

The district has developed a set of educational specifications for the standard elementary, middle and high school campus. These specifications contain instructional, environmental, structural, as well as technological standards to be used in all elementary, middle and high schools. As we construct or renovate schools, these technology standards become part of the construction specifications for that campus. Internal cabling for Internet access is one of those standards as are servers and operating systems that allow those connections to occur.

Technology will continue to be a major impact on education. As all careers become more dependent on the use of the computer and information technology, it becomes more important for each student to have access to computers in the classroom as a part of the curriculum. – teacher survey comment

To continue to support the instructional programs in the district, the following services are needed:

Timeline	Service Needed
2003-2006	continuation of phone service to campuses and individual classrooms
2003-2006	continuation of maintenance agreement for telephone system MAC and service
2003-2006	monitor utilization of bandwidth for the WAN
2003-2006	continuation of Internet access over the WAN
2003-2006	continuation of proxy filtering server
2005-2006	upgrade of PCs NIC to support gigabit ethernet
2003-2006	continuation of 2 way video capability to and from all district classrooms
2003-2006	file servers, routers, switches, hub replacements and maintenance agreements to facilitate network traffic
2003-2006	Internal cabling for network access in all new and renovated facilities

A listing of the district inventory follows.
